The purpose of temperature of fever

KM Yacob

Marma Health Centre, India

When the disease becomes threat to life or organs blood circulation decreases, temperature of fever will emerges to increase prevailing blood circulation. And it acts as a protective covering of the body to sustain life. When blood flow decrease to brain, the patient becomes fainted-delirious .If we try to decreases temperature of fever, the blood circulation will further reduced. Blood circulation never increases without temperature increase. Delirious can never be cured without increase in blood circulation. The temperature of fever is not a surplus temperature or it is not to be eliminated from the body. During fever, our body temperature increases like a brooding hen`s increased body temperature. The actual treatment to fever is to increase blood circulation.
