Minimally invasive workflow for interdisciplinary aesthetic treatments

Thameer Theeb

British Academy of Implant and Restorative Dentistry, Jordan

In the last few years, great achievements have been made in the field of Aesthetic and Adhesive Dentistry. Meeting the patients' desires and expectations with minimal prosthetic intervention is becoming a large issue to dentists. There are many tools and materials those can assist dentists in evaluating and achieving the best aesthetic outcomes. In this presentation, detailed analysis of the most significant clinical and technical procedures will be discussed. Starting with the clinical diagnosis and diagnostic wax up, smile test drive, and creating a harmonious occlusion with minimal restorative intervention will be described. We will review innovative sequencing techniques for interdisciplinary cases which require full mouth rehabilitation and minimally invasive approaches keeping patients' inputs and wishes in mind. The key to success is to preserve the original structure of the compromised tooth and on the other hand, involve a very low biologic intervention.
