Dentin hypersensitivity

Ahmed el-hoshy
Cairo University, Egypt

Dentinal hypersensitivity is a very common clinical condition usually associated with much routine dental treatment in our daily practice such as scaling and bleaching. It can affect patients of any age group in both arches. This lecture concisely reviews the etiology, mechanism and clinical management. Treatment should start with an accurate diagnosis. Differential diagnosis should be made and all other probable causes should be excluded. We are focusing to help the operators to solve this problem in a straight and easy way.

Biography
