## Vascular Factors in Post stroke Depression

Wai Kwong Tang<sup>1,2</sup>, Y Liang<sup>1</sup><sup>1</sup>The Chinese University of Hong Kong<sup>2</sup>CUHK Shenzhen research institute, China

Depression is common following an acute stroke. Poststroke Depression (PSD) have notable impacts on the function recovery and quality of life of stroke survivors. Incidence decreased across time after stroke, but prevalence of PSD tend to be stable. Vascular factors such as diabetes, hypertension and smoking have been related to the development of PSD. Many studies have explored the association between lesion location and the incidence of PSD. For example, lesions in frontal lobe, basal ganglia and deep white matter have been related with PSD. Furthermore, cerebral microbleeds and functional changes in brain networks have also been implicated in the development of PSD. In this presentation, evidences of such association between the above structural and functional brain changes and PSD will be reviewed.
