# PROSTHODONTICS & RESTORATIVE DENTISTRY

April 16-17, 2018 | Las Vegas, USA

## The effect of two nano filled resin-based coatings on color stability of five glass ionomer restoratives immersed in three different food simulating solutions

**Dana Jafarpur**

Shiraz University of Medical Sciences, Iran

**Objectives:** To evaluate the effect of different nano filled resin coatings on the staining susceptibility of glass ionomer restoratives after immersion in three food simulating solutions (FSS).

**Methods:** Five encapsulated glass-ionomer restoratives (Riva light-cure (SDI), Riva self-cure (SDI), Fuji II LC (GC), Fuji Bulk (GC), Equia Forte Fil (GC)) and two nano filled coatings (EQUIA Coat (GC) and G-Coat plus (GC)) were employed. All specimens were immersed in distilled water for 24 h and then subjected to a color measurement with a spectrophotometer. Then the samples were divided into three subgroups and immersed for another one week in lactic acid (0.1 mol/L), coffee and distilled water (control) respectively. The differences in the lightness and chromaticity values ( $\Delta L$ ,  $\Delta a$ ,  $\Delta b$ ) were determined and the total color change ( $\Delta E$ ) was calculated using the formula:

**Results:** Three-way ANOVA showed a significant interaction effect between materials, coatings and solutions for the color change values. Therefore, one-way ANOVA was used to compare different variables between the materials. Color change values ( $\Delta E$ ) varied depending on the material and solution. G-Coat Plus exhibited lower color change values compared to the EQUIA-coated and the uncoated groups. The effect of immersion in FSS on color change values among materials varied depending on the type of coating.

### Biography

Dana Jafarpur is a sixth year Dental student at Shiraz University of Medical Sciences. Next semester she will be graduating Summa cum laude from Shiraz Dental School and has written a book on Forensic Dentistry and published 5 papers during her undergraduate studies.
