

32nd Asia Pacific

DENTAL AND ORAL HEALTH CONGRESS

July 23- 24, 2018 Sydney, Australia

Smile design for implant placement

Diksha Singh

Ram Manohar Lohia hospital, India

Innumerable scientific studies are conducted to find reliable indicators of the biological potential of premalignant diseases and cancerous lesions. These markers have a wide range of potential applications and they have been used as aids to screening, diagnosis, prognosis and monitoring the response to treatment. Estimations of such markers might permit selection of the most appropriate treatment for the individual cancers. Serum β 2 microglobulin (B2M), a tumor marker showed significantly increased concentrations in patients with OSCC and those with keratosis and epithelial dysplasia but with no evidence of invasion.
