Oral Cancer with rare Etiology (Causes) : A Series of three case studies

K Divyasree Bhat

C.K.S Theja Institute of Dental Sciences and Research, India

Oral cancer is one of the most heard and deadly disease of current decade. The most common etiology for oral cancer is smoking tobacco in various forms, chewing guthka or paan, and intake of alcohol. These causes have a definite risk factors in various associated neoplasms not only the oral cavity and surrounding tissues, but also the over all human body. Interestingly three cases were studied which was reported to our institution had none of these etiology. The main cause found out were the association of HIV (human immunodeficiency virus), HPV (human papilloma virus) and Candidiasis. We hereby report series of case reports of oral cancer associated with unusual different and rare aetiology.

KEY WORDS: Oral Cancer, Unusual and Rare Etiology, Case reports.
