Multi-disciplinary approach in implant dentistry: Key factors for prosthetically driven implant rehabilitation

Ankit Mashru

Jaslok Hospital & Research Centre, India

The rehabilitation of an edentulous space aims to return esthetics, function, comfort, phonetics and health to the patient. Certain clinical cases of oral rehabilitation require interdisciplinary treatment with the need for orthodontic treatment, endodontics, and prosthetically driven implant placements. Multi-disciplinary planning based on diagnostic wax setup casts to determine exact implant location and orientation in line with future orthodontic tooth displacements and prosthetic implant crown restorations is the most important step in the overall treatment planning. This lecture describes many such case series of rehabilitation involving orthodontics, surgery, implant insertion and aesthetic restorative dentistry, with an implant-supported prosthesis approach..
