## Facial swelling: Sometimes is challenging for dentists

**Javad Faryabi**

Kerman University of medical Sciences, Iran

Currently, when a dentist seeks a treatment for facial swelling of his/her patients, the first diagnosis and cause of swelling that he/she thinks about it, maybe and perhaps always is the teeth of the patients and an finally is an odontogenic infection. But sometimes it is not true, and this is not the correct answer to the patients for managing their discomfort, because they are worried about their health, and may go to several offices of dentists or other physicians and specialists for treatment of their disease, actually they need to additional work ups like CT-Scans, CBCT, MRI, Sonography, and etc. to discover the exact cause of their facial swelling, so this presentation the author will introduce to several examples of such facial swelling in my patients related to maxillofacial region and proper management of them.
