MEASURING SAFETY CULTURE: THE IMPROVEMENT JOURNEY OF A LEADING SAUDI TERTIARY HOSPITAL

Nada AlHarbi*

*King Faisal Specialist Hospital & Research Center, Saudi Arabia

Providing a safe health care starts with improving the culture of patient safety. KFSH&RC understands this very well, therefore, has invested in a major project in assessing the hospital staff perception on the culture of patient safety. The 2015-2016 Patient Safety Culture survey utilizing the AHRQ assessment tool was conducted over a year long period in collaboration with an American consultancy company. The project included building a survey administration & analytical portal, this collaboration helped in assuring that the survey was anonymous. For the first time, the hospital had measured its safety culture, climate at the unit level, including clinical and non-clinical areas with a 56% response rate. The Survey results were correlated with Patient Satisfaction surveys and staff satisfaction scores, moreover, the results were correlated with units voluntary reported events. Additionally, for the first time the results were drilled down to the unit level. The results were, then revealed in a 4 hour debriefs session by the consultancy agency, the hospital positive response to culture of patient safety 12 composites were compared to international results. As a result, Major improvements actions underwent by the hospital executives and quality division. Just culture program, Event reporting campaign and a good catch program to name a few. Almost three months later a pulse check was conducted with additional customised questions by end users, which revealed a slight improvement, however, still the journey is far from over.
