Esthetic and functional rehabilitation of peg-shaped maxillary lateral incisors: practical recommendations**Nadine Omeish***University of Paris, France*

Peg-shaped maxillary lateral incisors cause many functional and esthetic major consequences in affected patients. Their aesthetic and functional rehabilitations are often multidisciplinary, involving different clinical procedures like periodontal, orthodontic, or prosthodontic procedures. No exhaustive protocol has been established to improve their comprehensive management by general dentists or specialists. With my team, we elaborated a simplified clinical protocol of complete management of peg-shaped maxillary lateral incisors by a multidisciplinary team (general practitioners, orthodontists, and prosthodontists).

Biography

Nadine Omeish is a dentist from Paris, France. She obtained her DDS at Paris-Cité University. She also has a residency diploma and obtained her research master in Neurosciences in 2019. Afterwards she was an assistant lecturer till 2021. Now, she has a private practice in Paris, France.
