

Surgical and prosthetic protocol for unitary implant in healed flange

Oscar Arauco Urzagaste

Private Dental Practice, Bolivia

This case presentation is about a 19 year old female patient who reported that, eight years ago, the upper right lateral incisor was detected radiographically retained in an unfavorable position, so it was decided at the time to do the surgical extraction and orthodontic treatment. She has used a removable acrylic prosthesis ever since and now wishes to replace tooth 12 with an integrated bone implant. This case description of the treatment will be discussed in detail with images in my presentation.
