

International Conference on VACCINE RESEARCH

February 07, 2022 | Webinar

Ways of making and effective and safe vaccines against SARS-CoV-2**Md.Selim Reza***Bangabandhu Sheikh Mujib Medical College, Faridpur, Bangladesh*

Severe acute respiratory syndrome (SARS) is an emerging infectious disease caused by the SARS-associated coronavirus (SARS-CoV). Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2) is another new type of coronavirus that causes Coronavirus Disease 2019 (COVID-19), the most challenging pandemic in this century. SARS-CoV-2, which is genetically similar to SARS-CoV and Middle East respiratory syndrome coronavirus (MERS-CoV), is an enveloped, single and positive-stranded RNA virus. Considering its high mortality and rapid spread, an effective vaccine is urgently needed to control this pandemic. Several vaccines, such as inactivated, attenuated, nucleic acid-based, and vector vaccines, have already demonstrated their prophylactic efficacy against MERS-CoV and SARS-CoV so that these candidates could be used as a potential tool for the development of a safe and effective vaccine against SARS-CoV-2. The inactivated SARS-CoV vaccine may be the first available for clinical use because it is easy to generate; however, safety is the primary concern. SARS-CoV's spike (S) protein is the primary inducer of neutralizing antibodies, and the receptor-binding domain (RBD) in the S1 subunit of S protein contains multiple conformational neutralizing epitopes. This conclusion means that recombinant proteins with RBD and vectors with the RBD sequence can be used to make safe and effective vaccines for SARS-CoV-2.

Biography

Md. Selim Reza is currently working as a lab consultant at the RT-PCR Laboratory at Bangabandhu Sheikh Mujib Medical College, Faridpur, Bangladesh. He has visited more than ten COVID-19 laboratories during this pandemic situation to train the medical doctors and technologists on COVID-19 detection using Real-time PCR in different government medical colleges and hospitals. He completed his BSc. and MS at the Dept. of Biochemistry and Molecular Biology, Jahangir Nagar University, Savar, Dhaka, Bangladesh. He has contributed to seven international publications about diagnosis and treatment and making effective vaccines for COVID-19.
