

Implications in Veterinary Medicine and Welfare and its Effective Therapy

David Paul*

Department of Environmental Health and Engineering, Johns Hopkins University, Baltimore, USA

DESCRIPTION

Veterinary medicine, also known as veterinary science medicine, it has a specialist involved in the prevention, management, diagnosis and treatment of diseases that affect the health of livestock and wild animals, and the prevention of transmission of animal diseases to humans. Veterinarians ensure a safe food supply by monitoring and maintaining the healthy way of food-production in animals. Traditionally, human medicine and veterinary medicine are considered separately.

Doctors treat people and veterinarians take care of animals. Of course, there are differences between the two types of patients and in treatment options. For example, euthanasia tends to frown in humans, but in veterinary medicine it may be the best approach. Similarly, culling an infected or suspected individual but, it is not an option for controlling the development of human infections; it can also be for animals. Doctors usually have an advantage over veterinarians in that they can talk to the patient. If the patient can speak, the life of a veterinarian will be much easier. Despite the differences between the two professions, they share common interests and common challenges. Veterinarians and doctors are increasingly being asked to work together. For example, the fear of the bird flu could be a precursor to human pandemic and the management of food poisoning zoonosis.

Veterinarians play an important role in one health because animals affect and are affected by both humans and the environment. Whether you are a clinician, epidemiologist or environmental expert, veterinarians are essential to promoting one health and protecting the health and safety of the three pillars of animals, people and the environment. Veterinary medicine is used to improve or maintain the health of an animal species, whether or not it is intended for food production. They are designed and manufactured to cover a wide range of preventative and therapeutic purposes and are administered to

livestock, exotic, wild and food-producing animals. Based on the experience of providing collective X-ray examination consultations for over 60 years, film radiology research is often problematic. These included over exposure, under exposure, darkroom errors, improper positioning, and improper views. All of these issues were easy to solve, but failed in many ways. The transition to digital radiography helps alleviate X-ray imaging problems and eliminates darkroom errors.

When it comes to protecting the health and well-being of animals, no animal is as devoted and well-equipped as a veterinarian or our team. It's not just about taking care of sick and injured animals. Provide preventive care and screening to stay healthy, work with owners to ensure nutritious food, support weight management, provide behavioral and training guidance, and pet choices. Veterinary medicine is the medical profession at the interface between animals and people.

Although a majority of veterinarians provide medical care for pets and food animals, professional activities of veterinarians also include preventing the transmission of zoonotic diseases from animals to humans, wildlife preservation and conservation, and public health. The broad, comparative training veterinarians receive in the biological sciences prepares them to care for a wide range of animal species, and uniquely positions them to serve as valuable team members in the promotion of human health and protection of the food supply.

Veterinary medicine and the care of zoo and aquarium animals and wildlife will continue to evolve; just as societal norms regarding our relationship with animals evolves. Even our vocabulary reflects a division of perspectives. For example, animal rights groups refer to "captive" or "caged" animals that live in zoos, while zoos refer to "caring animals" and their proof of the world's animal welfare. Raise awareness of your efforts. People take care of animals from both perspectives, but they have very different views on how their advocacy and care should be transformed into ensuring animal welfare.
